

# Modal and Modeless Dialogs

"modal dialog" and a "modeless dialog" refer to two types of dialog boxes used in graphical user interface (GUI) applications.

# Modal Dialog

- A modal dialog is a window that blocks input to other windows in the application until the dialog is closed.

# Modeless Dialog

- A modeless dialog is a window that allows the user to interact with other windows in the application while the dialog is open.
- It doesn't block the main application window.

# Modeless Dialog - Issues

- Memory Leak

Use `PostNcDestroy()` if needed

- Window Instance Maintenance

Use static member if needed
